Svmap Cheat Sheet

Svmap

Source: <https://github.com>

Svmap tool is designed to identify sip devices and PBX servers on a network. Svmap sends UDP packets containing SIP requests to specified IP addresses and lists those that respond with valid SIP replies. Svmap contains a list of methods which can be used to specify the scanning method, such as INVITE, REGISTER, etc.

1. [Svmap Options](#)
2. [Svmap Methods](#)
3. [Svmap Commands](#)
4. [Svmap Commands to Specify Range of IP Address](#)

1. Svmap Options

Syntax	
svmap [options] host1 host2 hostrange	
Options	
--version	Displays program version number and exit
-h, --help	Display help message and exit
-v, --verbose	To increase verbosity
-q, --quiet	Quiet mode
-s NAME, --save=NAME	Save the session

--resume=NAME	Resume a previous scan
--randomscan	Scan random IP addresses
-i scan1, --input=scan1	Scan IPs which were found in a previous scan. Pass the session name as the argument
-p PORT, --port=PORT	Specify the destination port or port ranges of the SIP device
-P PORT, --localport=PORT	Specify the source port for our packets
-x IP, --externalip=IP	Specify the IP address to use as an external IP address
-b BINDINGIP --bindingip=BINDINGIP	Binds to the specified IP address
-t SELECTTIME, --timeout=SELECTTIME	Timeout for the select() function
-c, --enablecompact	To enable compact mode. Makes packets smaller but possibly less compatible
-m METHOD, --method=METHOD	Specify the request method - by default this is OPTIONS.
-d, --debug	To print the received SIP messages
-R, --reportback	Send the author an exception traceback
--randomize	Randomize scanning instead of scanning consecutive IP addresses
--srv	Scan the SRV records for SIP on the destination domain name
--fromname=FROMNAME	Specify a name for the from header
--fingerprint, --fp	To enable fingerprinting
--first=FIRST	Send the first given number of messages only
-e EXTENSION, --extension=EXTENSION	Specify an extension - by default this is not set
-I scan1, --inputtext=scan1	Scan a group of IP addresses found in a last scan
-A, --autogetip	Obtains the current IP address automatically

2. Svmap Methods

Method	Description
INVITE	Use to invite a client to a session
ACK	Confirmation of client receiving the final response to INVITE request
BYE	Terminates the session
CANCEL	Deletes any pending request
OPTIONS	This method lists the capabilities of the server(options)
REGISTER	The listed address is registered in the To header field with SIP server by this method
PRACK	Provides provisional acknowledgement
SUBSCRIBE	This method subscribes for an Event of notification from the notifier
NOTIFY	This method will notify the subscriber about new event
PUBLISH	This method is used to publish an event to the server.
INFO	Sends mid-session information
REFER	Used for asking recipient to issue SIP request
MESSAGE	Used for sending instant message using SIP
UPDATE	Used to modify the state of the session

3. Svmap Commands

Command	Description
<code>./svmap <IP address/Subnet mask> -v</code>	Scan a subnet with verbose mode
<code>./svmap <IP address/Subnet mask> -p1024-2080 -c</code>	Scan a subnet running compact mode on port range 1024-2080
<code>./svmap -s scan1 <IP address/Subnet mask></code>	Scan a subnet and save the results to a session named "scan1"

<code>./svmap -i scan1 -m INVITE</code>	Scan a list of previously scanned hosts and make use of the INVITE method
---	---

4. Svmap Commands to Specify Range of IP Address

Command	Description
<code>./svmap <IP address/Subnet mask></code>	Using CIDR notation
<code>./svmap <target name></code>	Name instead of an IP address
<code>./svmap <target name/Subnet mask></code>	Using CIDR notation with the name
<code>./svmap <target ip1>-<target ip2></code>	Using "-"
<code>./svmap <target ip>-20</code>	Using shorter method
<code>./svmap 1.1.*.*</code>	Using wildcard
<code>./svmap <target ip>-20 1.1.2.* <target website>/24</code>	Combines the above methods
<code>./svmap --randomscan</code>	Randomly scans the internet ranges
<code>./svmap --randomize <target website>/24</code>	Randomly scans the internet ranges using name of the website
