s3scanner Cheat Sheet

s3scanner

Source: <https://github.com>

s3scanner is designed to scan and enumerate object storage buckets across various cloud providers. It is beneficial for identifying publicly accessible buckets and assessing their security configurations. s3scanner offers a range of options for outputting scan results, such as saving data to a PostgreSQL database or printing logs in JSON format for easier processing and integration with other tools.

Syntax	
\$ s3scanner -bucket-file names.txt -enumerate	
Options	
-bucket	Name of bucket to check.
-bucket-file	File of bucket names to check.
-mq	Connect to RabbitMQ to get buckets. Requires config file key "mq". Default: "false".
-db	Save results to a Postgres database. Requires config file key "db.uri". Default: "false".
-json	Print logs to stdout in JSON format instead of human-readable. Default: "false".
-enumerate	Enumerate bucket objects (can be time-consuming). Default: "false".
-provider	Object storage provider: aws, custom, digitalocean, dreamhost, gcp, linode, scaleway - custom requires config file. Default: "aws".
-threads	Number of threads to scan with. Default: "4".
-verbose	Enable verbose logging. Default: "false".

-version	Print version. Default: "false".
-----------------	----------------------------------

s3scanner Commands

Command	Description
s3scanner -bucket secret_uploads	Scan a single bucket
s3scanner -bucket-file names.txt	Scans every bucket name listed in the file
s3scanner -bucket-file names.txt -enumerate	Scans AWS for bucket names listed in the file names.txt and enumerates all objects within those buckets.
s3scanner -provider gcp -db -bucket my-bucket -enumerate	Scans a specified bucket (my-bucket) in GCP, enumerates all objects, and saves the results to a PostgreSQL database.
s3scanner -mq	Connects to a RabbitMQ server and consumes messages containing bucket names to scan.
s3scanner -bucket images -db	Saves all scan results to a PostgreSQL database.
s3scanner -bucket images -json	Outputs scan results in machine-readable JSON format.
s3scanner -bucket attachments -enumerate	Enumerate all objects stored in the bucket.
s3scanner -bucket assets -provider gcp	Specify the storage provider when checking buckets.
s3scanner -bucket secret_docs -threads 8	Set the number of threads to scan with.
s3scanner -bucket spreadsheets -verbose	Enables verbose logging of debug messages.
s3scanner -version	Print the version info and exit.
